

F1-score of individual pipelines and of ensembles of 2 to 6 pipelines

One row per sequencing center; ensembles keep the variants called by at least k of their pipelines (Min voting required = k). SomaticSniper calls are not PASS-filtered.

Each ensemble panel: one point per combination of pipelines at each threshold (every combination is drawn, offset horizontally at random within its threshold); grey lines join 2,000 sampled combinations across thresholds. Red dashed line: the best individual pipeline of the center. Red marker and value: the highest F1 in the panel. Individual panels: the four trimming and recalibration settings of a mapper-caller pair side by side.
